1.0 Proposed Project Summary

Jawatan Perwakilan Kolej UiTM Perlis wants to build an application that can provide laundry pickup service for college residents Dahlia, Cengal and Kesinai. This is to ease the burden of residents. The program will ask the students to enter their student ID and password for verification that they are a student in UiTM. If the confirmation is admitted, then the laundry pickup service program will start.

Then, the program will ask the user to choose between laundry, dry-cleaning, or both by entering the code given.

CODE	TYPE OF SERVICE
1	LAUNDRY ONLY
2	DRY-CLEANING ONLY
3	LAUNDRY & DRY-CLEANING

TABLE 1.1 CODE FOR EACH TYPE OF WASHER

After that, the program will display a menu where the user can choose the weightage of the laundry bag, the temperature for laundry and dry cleaning separately.

WEIGHT(KG)	PRICE PER BAG (RM)
5	3.00
10	3.50
15	4.00
20	4.50
25	5.00
30	5.50

TABLE 1.2 PRICE FOR WEIGHT PER BAG

CODE	TEMPERATURE		PRICE (RM)
	LAUNDRY	DRY-CLEANING	
A	COLD	LOW	4.00
B	WARM	MEDIUM	5.00
C	HOT	HIGH	6.00

TABLE 1.3 TEMPERATURE PRICE FOR LAUNDRY AND DRY-CLEANING

After the user has successfully ordered, the program will calculate the total payment for the pickup and display student ID, residential college, type of service, temperature based on type of service, total net payment, total payment received, and payment balance in the form of a receipt.

2.0 Objective of the Project

The objective of this project is to help the college residents with their laundry problem that they are having, which is they have to go to laundry services outside the campus that are miles away from their residency and the prices are not student friendly. Thus, the residents will have a hard time managing their schedule because university students are often busy and it's not their priority. Furthermore, this laundry system that has been created would help out the residents and make it easier for them to do their laundry in a convenient way. We offer a variety of choices upon laundry with affordable prices and on top of that, a receipt is provided as a proof of payment in case anything happens.

3.0 Problem Analysis

Input:

- Enter student ID and password.
- Enter residential college.
- Enter the code for the type of service.
- Enter the weightage of the laundry bag.
- Enter the temperature for laundry and dry cleaning separately.

Process:

- Total payment for laundry service
    - sum of laundry weight price and temperature price for laundry and dry cleaning
- Total temperature price if user choose laundry and dry-cleaning service

Output:

- Display total net payment.
- Display student ID, residential college, type of service, total net payment.
- Display appropriate message based on laundry requirements.

4.0 Design Algorithm
